CC 2-6 (Hormone Pharmacology)

AB Ovulation inhibiting and peripheral effects of ORG 2969-ethinylestradiol  
mixt. [71138-35-7] were studied in healthy female volunteers.  
The combinations used were 0.015, 0.030, 0.075, 0.100, or 0.125 mg of Org  
2969 plus 0.050 mg of ethinylestradiol, 0.050 mg of Org 2969 plus 0.30 mg  
of ethinylestradiol and 0.150 mg of Org 2969 plus 0.020 mg of  
ethinylestradiol. These regimes were used daily in 21  
**day** periods with 7 day tablet-free intervals. In addn., 2  
normophasic drugs, one consisting of 7 day treatment with 0.050 mg  
ethinylestradiol followed by 15 day treatment with 0.125 mg of Org 2969  
plus 0.050 mg ethinylestradiol (+ 6 day tablet-free interval), and the  
other consisting of 7 day treatment with 0.05 mg of ethinylestradiol

followed by 15 day treatment with 0.150 mg of Org 2969 and 0.030 mg of ethynylestradiol (+ six day tablet-free interval) were also used. In all dose groups indicated above the 1st cycle served as control, during which no treatment was used. The control cycles were followed by treatment cycles, during which the volunteer received hormonal therapy indicated above for periods up to 8 mo. In 21 volunteers the 1st posttreatment cycle was studied as well. During every cycle, serum LH [9002-67-9], serum estradiol [50-28-2], and, in some cases, serum FSH [9002-68-0] were measured daily on days 7-23 and serum progesterone [57-83-0] on days 14-23. Basal body temp. was recorded daily, cervical mucus properties and vaginal smear were evaluated every 2nd day and endometrial biopsy was taken on the 21st or 22nd day of the cycles. The results of the hormone detns. suggest that all the pretreatment cycles were ovulatory and all the treatment cycles in all volunteers anovulatory. In most cases studied, the first posttreatment cycle was ovulatory. The endometrial biopsies showed a normal secretory pattern during the pretreatment cycles, drug-related changes during the treatment cycles and close to normal secretory pattern during the posttreatment cycles. Also the other peripheral parameter studied, cervical mucus properties, vaginal smear, and basal body temp. were in accordance with the results of the hormone detns. Thus, by combining Org 2969 with ethynylestradiol a drug with very high ovulation inhibiting activity is produced.
